

8 reasons house hackers check the numbers before the FHA pre-approval

Swipe →

01

Owner-occupied financing is modeled, not approximated

The house-hack snapshot uses low-down-payment terms and shows your effective monthly housing cost after the other units' rent comes in.

02

You see what the rented units cover

Live rent estimates for the address, scaled to the units you do not occupy. The difference between that and the payment is what the house costs you each month.

03

The exit is on the same screen

When you move out the property becomes a full rental. The long-term rental snapshot sits beside the house-hack one, so you know what it turns into before you buy it.

04

The verdict runs in 15 seconds, free

Paste any US address. Multi-source value, a rent estimate, the Deal Gap and six strategy snapshots come back without a signup or a card.

05

Three value sources, shown side by side

Zillow, RentCast and Redfin estimates are pulled live and blended into one IQ Estimate. Every source stays visible. When one has no data for the address it reads unavailable; nothing is made up.

06

The Deal Gap, in dollars

Asking price minus the price that works. That one number is the offer conversation, and it is on the screen before you have spoken to anyone.

07

Four ways to close the gap when price alone will not

A price cut, a capital ask, a financing change such as seller carry or a 0% second, or a blended plan of smaller asks that reaches the same math. Each is modeled on this address.

08

The assumptions are published, not hidden

Property tax, vacancy and appreciation for every state are on the /markets pages and shown in every verdict. Pro lets you edit them per deal and watch the math change.

DEALGAPIQ

Run the duplex before you run the pre-approval

Paste the address. The house-hack snapshot is part of the free verdict, no signup and no card.
